Storm Hazard Awareness and Preparation

1.0 Storm Hazard Awareness

When warned by the Weather Forecast, the Project Safety Manager/Field Construction Manager will designate a competent observer to monitor real time weather radar and warn the site when appropriate.

1.1 Thunder Storms

Thunderstorms are almost a daily occurrence in the summer but may occur anytime of the year. High winds and lightning are a certainty.

- a. Project personnel will monitor the storm progress toward the vicinity of the site.
- b. Personnel will be informed by the Project Superintendent to abandon scaffolding, form work, cranes and other areas where lightning may likely strike when the storm is approximately 5 miles from the site. The Field Construction Manager will inform line managers when they may return to work.
- c. Daily clean-up and proper bundling and stabilization of stored material must be maintained to minimize the possibility of debris and materials becoming airborne
